

Proxess Sync

Mobile Programming App

The Proxess® Sync mobile phone app

synchronizes changes from the ProxessIQ® software to the Proxess Intelligent Locksets and it uploads the Audit Trails from the locksets to the software.

You can also encode cards for users that have been added in the software. The app can be issued to an unlimited number of phones and users and connected with an unlimited number of doors.

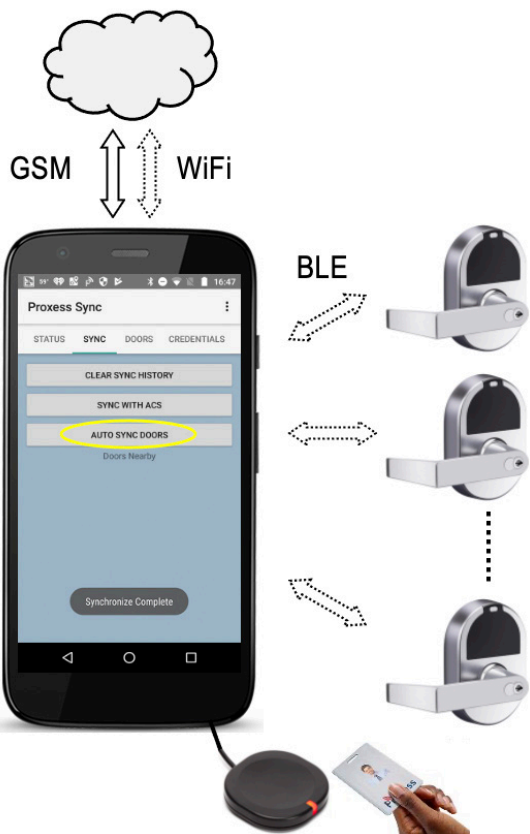

Proxess Sync is the simplest to use configuration app, requiring just a click to synchronize with the software and a click to update all the locksets. No further training is needed.

Changes typically include automatic unlock schedules, classroom time zone and lockdown adjustments, general lockset configurations and cardholder blacklists.

As soon as any time-sensitive change is made in the software, one or more app users may be notified to present their phone at the affected doors to perform the update and/or retrieve the audit log...Convenient and simple.

Re-think your access control strategy. Save money by just installing locksets and updating them with the Proxess Sync app. Then, connect only the doors frequently changed or requiring immediate notifications with our gateways. Proxess Sync is strictly a performance app. It is secure and uncompromising. There is no programming performed from the app. All of the configuration changes are securely made on the PC software and the app user simply presses sync to have the changes executed.

Beyond the low acquisition cost of a Proxess security system, the Proxess Sync app continues to save you time and money. The app allows either your closest untrained tech at the site to respond, or enlists the end user to provide a response in the form of a simple presentation of the app to the affected doors. The affirmation of the changes and uploaded events will immediately appear in the remote system software. More than one app may be asked to respond to a door without fear of data conflicts. Further, the app may reside on inexpensive smart phones with no mobile plan leveraging the customer's WiFi network for changes and uploads.

Proxess Sync is an Android phone compatible app which may be downloaded from the Google Play™ store.

Multi-Site: Each phone can be connected to any number of remote facilities.

At least one Proxess Sync app is required to program Proxess Intelligent Locksets in each system.

FEATURES

ON-DEMAND	The moment changes are made from any software client, a user may hold the app to the locksets to be updated.
CARD PROGRAMMING	Centralize your administration and encode cards in the field, including at remote locations with no connectivity. Spot-check and verify credentials with their stored photos in the field.
CONNECTIVITY	Use your facility's WiFi or the phone's mobile connection to synchronize with the AxessIQ™ software. Updates to the locksets are transmitted from the phone using BLE (Bluetooth Low Energy).
SIMPLICITY	Proxess Sync automatically synchronizes changes, and encourages issuing the app to as many potential users as desired. No training needed.
SECURITY	All programming changes are performed from a secure client PC software preventing any misuse if a phone is compromised. Encrypted security handshakes protect communication between apps and locksets.
REDUNDANCY	The Proxess Sync app may be deployed to any number of users, assuring a response to the updates required.

ADDITIONAL FEATURES

- ✓ On-demand changes to lockset operations and credential rights
- ✓ Encode, delete and spot-check credentials in the field
- ✓ "Hack-proof" operation: No configuration is performed on the phone
- ✓ Intuitive, no-fault operation: Just click to execute changes from the remote software programming
- ✓ WiFi and GSM\CDMA (mobile phone network) connectivity to the software
- ✓ Automatic transaction upload from the locks
- ✓ Unlimited apps per system and customer
